OBJECTIVE

Short-term: Enhance manual testing skills by gaining hands-on experience with complex web and mobile applications, focusing on improving test coverage and bug detection efficiency.
Long-term: Develop into a highly skilled tester, excelling in collaboration with teams and clients to effectively achieve shared goals.

WORK EXPERIENCE

CYBERLOGITEC

POSITION: QC ENGINEER

11/2025 - Now

Description

StarLinks is a web-based intermodal container transport portal used by a US drayage and rail logistics operator to manage the full shipment lifecycle. It covers booking creation and confirmation, rail billing, EDI exchange with rail carriers through 404, 998 and 322 messages, trucking work orders, and A/R and A/P invoicing, supported by master data for locations, routes, carriers, rate agreements and charge codes.

Responsibilities:

- Performed functional, regression, integration and E2E testing across Booking, Rail Billing, EDI, Work Order, A/R and A/P Invoicing.
- Analysed business requirements and identified functional gaps, ambiguities and missing test scenarios before test execution.
- Validated cross-module business workflows and data flows to prevent regression issues.
- Validated EDI 404 flat files field by field against client specifications and data mapping.
- Prepared and maintained test/master data for locations, routes, carriers, agreements, rates and charge codes.
- Analysed defects, documented evidence and retested fixes through closure.
- Conducted risk-based regression testing for releases and change requests.
- Tracked test progress, risks, blockers and defects and reported status to stakeholders.
- Collaborated with developers, BAs and clients to clarify requirements and expected behavior.
- Supported UAT with test scenarios, test data and issue investigation.
- Supported new developers in understanding business flows, business rules and system processes.
- Tool: Jira , Excel, SQL, Confluence
- Member team: 4

FIREGROUP

POSITION: QC ENGINEER

8/2023 - 11/2025

Description

Participated in an AI-powered e-commerce store scoring project that analyzed 14 key elements (header, footer, product display, etc.) from scraped HTML data. The system automatically evaluated each component's performance, assessed its impact on user experience, and provided data-driven optimization suggestions to improve conversion rates, along with generating detailed store performance reports.

Responsibilities:

- Analyze requirements and design effective Test Plans and Test Cases for software projects (Website).
- Use test management jira tools to manage test cases
- Run testcase results and bug reports
- Log clear defects with reproduction steps and evidence.
- Participate in team meetings, discuss testing issues and support peer testers.
- Collaborate closely with Developers, BAs, and PMs to clarify requirements and accelerate bug resolution.
- Provide usability and user-experience feedback from end-user perspective.
- Able to research and apply AI tools and techniques to support software testing.
- Working on projects managed under the Agile–Scrum methodology.
- Tool: Jira (AIO), Excel
- Member team: 8

Trained in automation applications

- The application is designed for buying, selling, and exchanging virtual currency, allowing users to perform transactions securely and efficiently. As a tester, my role is to ensure the application's functionality, identifying and reporting any issues that may affect the user experience.
- Technologies: Java, Selenium, Appium (server), Gherkin
- Role: Automation Tester

EDUCATION

Automation FC

10/2024 - 03/2025

- Specialization: Software Technology
- During my studies at school, I learned network installation, software testing and other subjects.

HoChiMinh University

08/2020 - 12/2024

- Specialization: Software Technology
- During my studies at school, I learned network installation, software testing and other subjects.

Testing VN (TVN)

4/2023 - 8/2023

- Fresher Manual Testing Course
- Manual Testing Course
